Radio Tagging Carp at Typo Lake

September 1, 2017
Carp captured by electrofishing or trap netting are anesthetized in a basin with low concentration clove oil.
Radio transmitter. The transmitter costs about $175 and is made by Isanti, MN company Advanced Telemery Systems. It has an approximately 3 year life. The transmitter sends signals every few seconds that can help an antenna operator locate the fish. The transmitter does not continually map the fish's location.
Incision and transmitter implantation
Incision is closed using veterinarian sutures that self dissolve during healing.
Antenna protrudes through opening just behind the main incision. The patient is returned to a tub of water to ensure full recovery before release.
Radio receiver will allow later locating of the carp.
